**Dear Editor**

Recently, we have reported the neutralizing efficacy of CovaxinTM against B.1.617.1 variant [1].SARS-CoV-2 variants have emerged and spread to other countries during this pandemic [2]. Many of the studies have reported reduced neutralization capabilities of vaccines viz., mRNA-1273, NVX-CoV2373, BNT162b2, and ChAdOx1-nCoV19 against different variants B.1.1.7, B.1.351 and B.1.1.28 P1 [2-3]. Recently, SARS-CoV-2 variant, B.1.617.1, B.1.617.2 and B.1.617.3 have been reported from India [1,4], which has been associated with increase in cases [4]. This variant has been shown to have higher transmissibility and pathogenicity in hamster model and has raised serious concern pertaining to the national COVID-19 vaccination program in India and other countries [4,5]. Over 177 million doses of vaccine have been administered to Indian citizens with two approved vaccines- Covishield (Astrazeneca-Oxford) and Covaxin$^{TM}$ (BBV152) [6]. We have also previously demonstrated the neutralizing efficacy of Covaxin$^{TM}$ against the B.1.1.7 and B.1.28 variants [7,8]. Covishield comprises the larger proportion in the vaccination program in India. Hence, it is of utmost importance to understand neutralizing capability of Covishield vaccine against this emerging variant.

We have evaluated neutralizing capability of the Covishield vaccine receipient sera obtained four weeks after the second dose of COVID-19 naïve subjects (n=43) and COVID-19 positive recovered subjects (n=18).

The neutralizing-antibody (NAb) titer against B.1.167.1 and prototype B.1 variant (D614G) was determined for both the categories of sera. Of the sera obtained from COVID-19 naïve subjects, 23.25% samples (n=10) didn't show NAb titer against both the variants. 27.90% of the samples (n=12) showed NAb titer only with B.1. A total of 21 serum specimens (48.83%) elicited NAb titers against both B.1

and B.1.617.1 variants. The GMT along with standard deviation of Covishield vaccinee sera against B.1 and B.1.617.1 were 42.92±3.8 (95% CI:40.21-128.5; n=43) and 21.92±4.42 (95% CI:24.4-62.64; n=43) respectively.

The results demonstrated that sera of COVID-19 positive recovered subjects (n=18, red color) who received two doses of Covishield have higher antibody response compared to the COVID-19 naive vaccinees (n=43, green color) with a significant difference (p<0.0001) in NAb titer against B.1 and B.1.617.1 variants (Figure 1A and 1B). An increase in the GMT of the sera of COVID-19 recovered cases with vaccination (29.5 fold) compared to COVID-19 naïve vaccinees (23.5 fold) was observed against B.1 and B.1.617.1 respectively. This indicates that COVID-19 recovered cases vaccinated with 2 doses had very high immune response in comparision to COVID-19 naïve vaccinees who received 2 doses.

A pair-wise comparison using Wilcoxon matched-pairs signed-rank test demonstrated a significant two-fold reduction (p-value<0.0001) in the neutralization titer of B.1.617.1 compared to B.1 variant in the COVID-19 naïve vacinees (Figure 1C). Further, we also determined the IgG titer against S1-RBD and observed a non-significant difference between COVID-19 recovered cases administered with 2 dose of vaccine and COVID-19 naïve vaccinated subjects (Figure 1D).

Although we observed a reduction in the neutralizing titer against B.1.617.1 variant, Covishield vaccine-induced immunity may still limit the severity of disease and mortality in the vaccinated individuals. Also COVID-19 recovered individuals with immunization can maintain protective antibody titer for longer period.
